Object: **Offer for a Post Doctoral position**

The group Functional Imaging of transcription is currently offering a post doctoral position. The successful candidate will use primary human cells to work on fundamental transcription reprogramming events driving dermal fibroblasts in the myofibroblast differentiation path. Initially ChIP-Seq will be applied to the differentiating cells and in a second phase more specific genes will be studied. The candidate will be required to have a strong background in Molecular Biology. Chromatin IP prior experience will be a plus.

Candidates should address their CV as well as a motivation letter to Xavier Darzacq (darzacq@ens.fr)
